
Science is the Exit Strategy: Lessons from the Story of Covid19 Vaccine Development

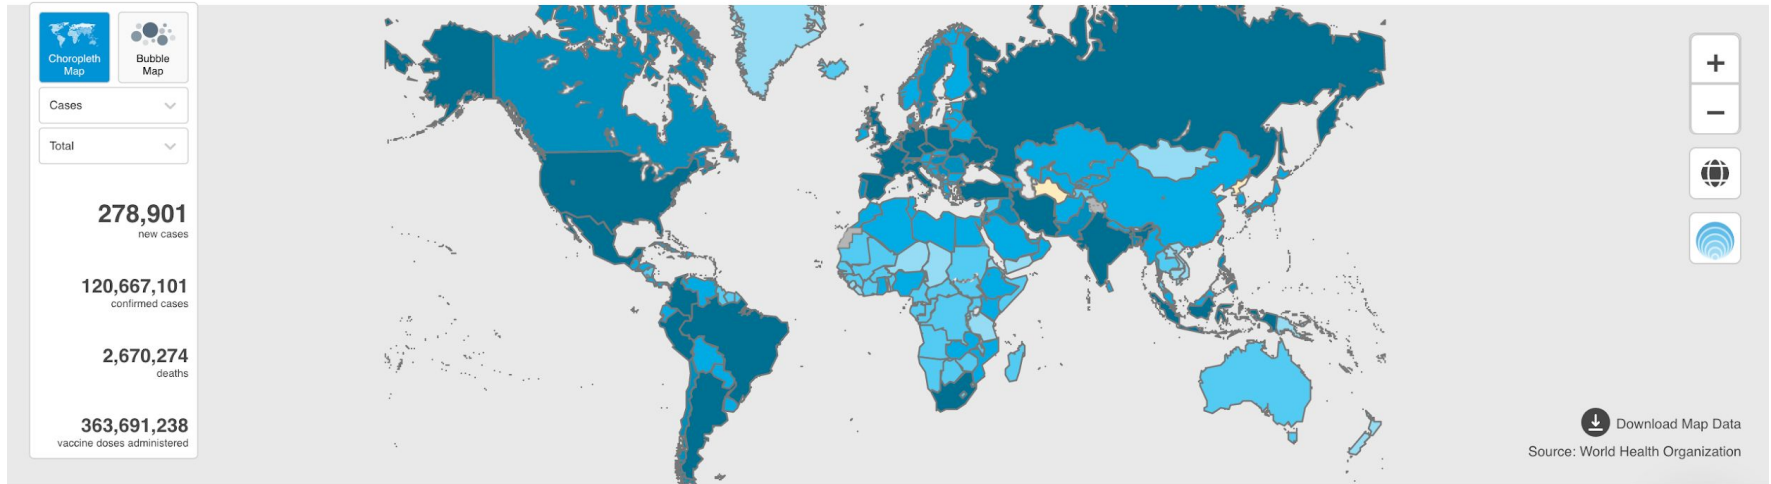

Dr. Alan Bernstein, President & CEO

WHO Coronavirus (COVID-19) Dashboard

[Overview](#)

[Data Table](#)

[Explore](#)

Globally, as of **1:27pm CET, 18 March 2021**, there have been **120,667,101 confirmed cases** of COVID-19, including **2,670,274 deaths**, reported to WHO. As of **16 March 2021**, a total of **363,691,238 vaccine doses** have been administered.

How vaccines work

- Vaccines greatly reduce the risk of infection by training the immune system to recognize and fight pathogens such as viruses or bacteria
- Vaccines safely deliver an **immunogen** which is a *specific type of antigen that elicits an immune response*, to train the immune system to recognize the pathogen when it is encountered naturally.

...vaccine...

...for a **recombinant vector vaccine**, put it in another virus so that it makes spike proteins too.

...which shows the immune system this

Cells infected by the vaccine produce spike protein as if they were infected by SARS-CoV-2

...for a **subunit vaccine**, use it to mass produce spike proteins.

Lots of copies of free-floating spike protein

...for a **nucleic-acid vaccine**, just make lots of copies of the spike protein gene.

Cells which have taken up the gene producing spike protein and thus looking infected
